Summary. The kidney plays a central role in fluid, electrolyte, acid-base, and mineral balance. It contributes to the regulation of erythrocyte production via erythropoietin, and glomerular damage can result in serum albumin abnormalities. Therefore, while blood urea nitrogen (BUN) and serum creatinine (Cr) are the most common indicators of kidney function, many other serum biochemical analytes can be influenced by renal disease and should be evaluated in conjunction with the BUN and Cr.

Your health care provider  
will use a blood test to  
check your kidney function.  
The results of the test mean  
the following: a GFR of 60  
or more is in the normal  
range. Ask your health care  
provider when your GFR  
should be checked again. a  
GFR of less than 60 may mean  
you have kidney disease.  
Talk with your health care
